

(1a) Yes. One solution would be: *Interval Scheduling* can be solved in polynomial time, and so it can also be solved in polynomial time with access to a black box for *Vertex Cover*. (It need never call the black box.) Another solution would be: *Interval Scheduling* is in NP, and anything in NP can be reduced to *Vertex Cover*. A third solution would be: we've seen in the book the reductions $\text{Interval Scheduling} \leq_P \text{Independent Set}$ and $\text{Independent Set} \leq_P \text{Vertex Cover}$, so the result follows by transitivity.

(1b) This is equivalent to whether $P = NP$. If $P = NP$, then *Independent Set* can be solved in polynomial time, and so $\text{Independent Set} \leq_P \text{Interval Scheduling}$. Conversely, if $\text{Independent Set} \leq_P \text{Interval Scheduling}$, then since *Interval Scheduling* can be solved in polynomial time, so could *Independent Set*. But *Independent Set* is NP-complete, so solving it in polynomial time would imply $P = NP$.
